

EG60411 Bio-Material Science

Toshiharu Enomae

Professor, PhD, Paper Device and Eco-friendly materials

2G103, 10:10-11:25, Tuesday

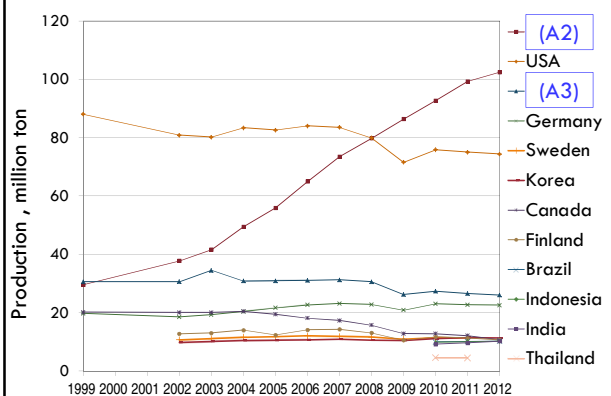

Biomaterial Science (Schedule)

#	Date	Content
1	4/15	History of papermaking
2	4/22	Pulps – Beating and fiber properties
3	5/9, Fri	Pulps – Additives and functions
4	5/13	Papermaking processes & interfiber bonding
5	5/20	Paper– Structural and absorption properties
6	5/27	Paper– Mechanical and optical properties
7	6/3	Polysaccharide chemistry by Assoc Prof Akiko Nakagawa
8-9	6/10, 17	Pulping science and technology by Professor Hiroshi Ohi
10	6/24	Recent trend of paper science and technology

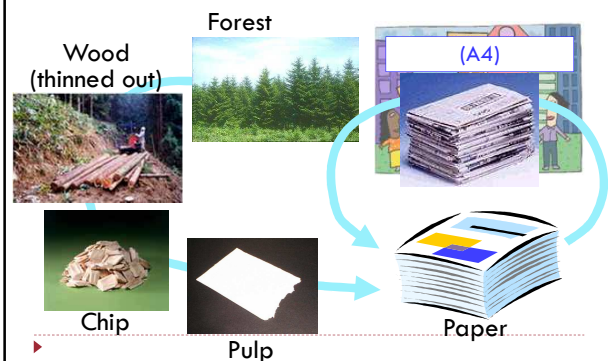

Lecture information and contact

Production of paper and paperboard

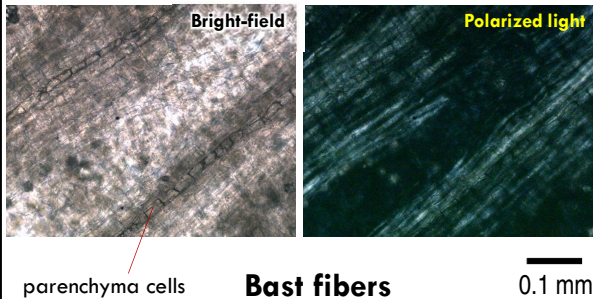

How to make paper ▶ From “wood”

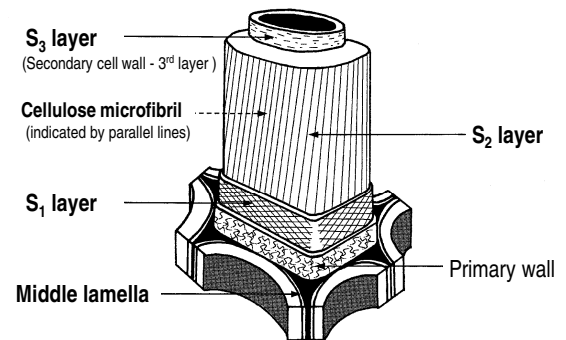

Wood tissue – cells of beech tree

Axial parenchyma cell

Wood tissue – structure of cell wall

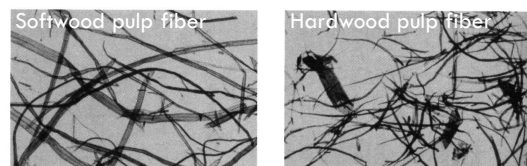

Structure of plant cell wall and axial direction of cellulose microfibrils

Kind of pulp

■ Pulp

- ▶ **Fibers mainly consisting of cellulose extracted from plant such as wood by mechanical or chemical treatment**
- **Mechanical pulp [MP]**
 - ▶ Fibers extracted from wood by crushing
- **Chemical pulp [CP]**
 - ▶ Fibers extracted from wood by dissolving lignin
- **Deinked pulp [DIP] (recycled pulp)**
 - ▶ Fibers extracted from waste paper by removing ink

Chemical pulp – Fiber geometry

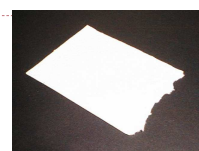

- ▶ Copy paper consists of (B) wood pulp fibers
- ▶ Observe pulps

Wood composition – Major 3 components

Chemical component	Approx. ratio (%)		Hardwood	Bleached kraft pulp
	Softwood	Hardwood		
Cellulose	45	45	Cellulose 45 %	40 %
Hemicellulose	25	30	Hemi-cellulose 30 %	10 %
Lignin	25	20	Lignin 20 %	2 %
Others Terpenoid Resin acid Fatty acid etc.	2 - 8		Others 5 %	5 %

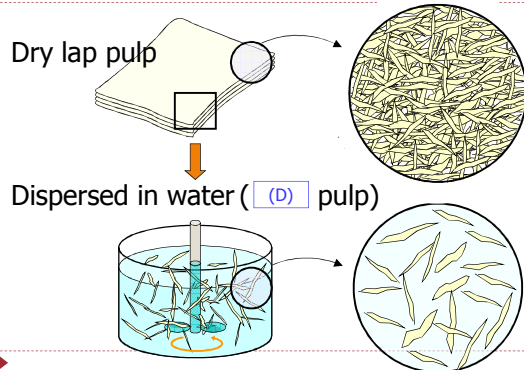

Change of Composition by kraft pulping

Form of pulp

- ▶ **Slush pulp**
Pulp suspension with concentrations of approx. 1-4%
- ▶ **Lap pulp**
Pulp Formed and folded by wet machine. Called "Dry lap" when dried
- ▶ **Bale pulp**
A bunch of pulp sheets compressed and bound with a wire

Disintegration - Separation into individual fibers

Standard disintegrator (defibrator)

- ▶ Pulp is put in water in steel container with ca. 3.4 L capacity
- ▶ Stirred with a propeller mixer at 3000 min^{-1} (rpm)
- ▶ Latency of MP should be removed at high temperature (Latent=hidden)

Pulp	Dry mass	Water volume	Revolutions
Chemical	30 g	2.0 L	30,000
Mechanical	60 g	2.7 L	60,000

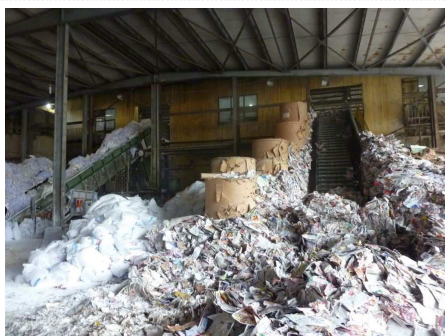

Waste paper in yard

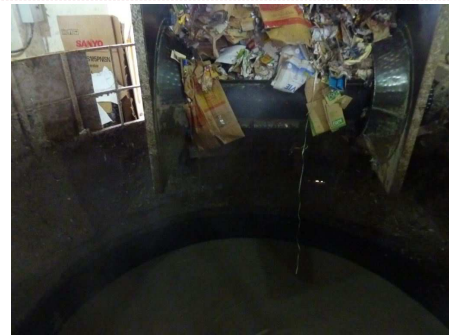

Waste paper and pulp

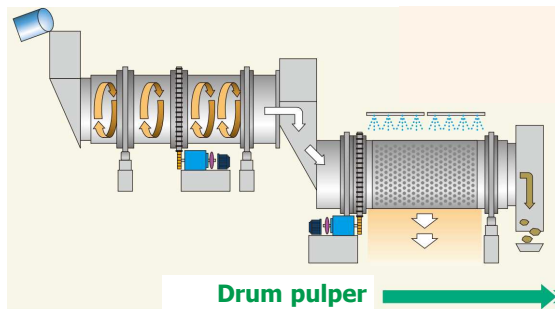

Belt conveyer

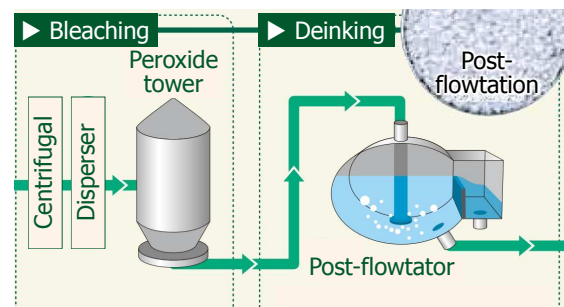

Disintegration in industry (pulper)

Disintegration in industry (Drum pulper)

Floatation

Floatation (flowtator)

Beating (refining)

- ▶ Post-disintegration process
- ▶ Process where shear stress is applied to water-containing fibers resulting in **fibrillation** (formation of small filaments or fibers) on the surface and **concentrically loose structure**

Beating (refining)

- ▶ Beating achieves large bonded area between fibers and thus higher paper strength.

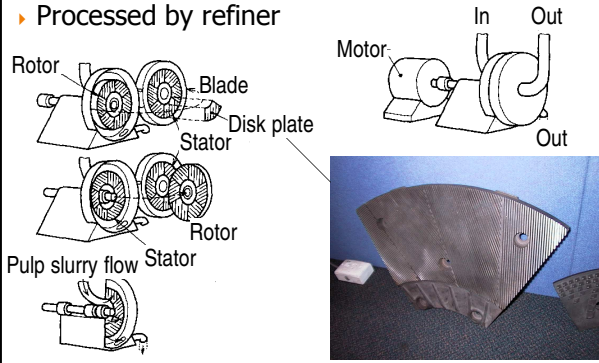

Q. Why can this breaking process increase paper strength?

Difference between **disintegration** and **beating**

- ▶ **Disintegration** is a process to separate fibers bonded or entangled, keeping fiber characteristics
- ▶ **Beating** is a process to treat mechanically individual fibers, changing fiber characteristics

Beater – Refiner(refining)

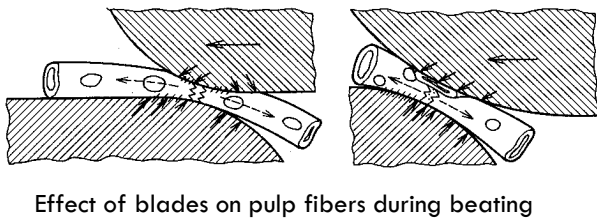

► Processed by refiner

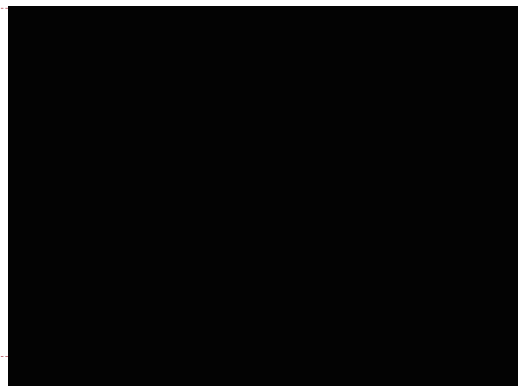

Beater – PFI mill (beating)

Beating – mechanism

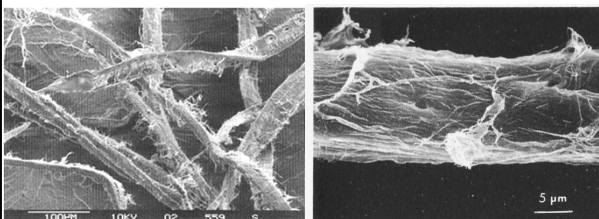

Refining – movie – refiner

Beating – change of fibers – external fibrillation

- { External fibrillation
- { Internal fibrillation

Scanning Electron Micrographs of freeze-dried softwood pulp fibers after beating

Beating – change of fibers – internal fibrillation

- { External fibrillation
- { Internal fibrillation

= Concentric loosening (Lamellar separation)

Connection of small pores formed by lignin removal

Lamellar separation of fiber cell wall by beating
